

AQUASOL GLITTER PASTE

Binder Paste for High Gloss and Transparent Gel Print

Type	Chemical Composition	Supplied Form	Ionicity	pH
Glitter Paste	Binder concentrate	High viscosity off-white paste	Anionic	>7

Properties

Aquasol Glitter Paste is formulated to provide premium elastic and high gloss prints on cotton-based and cotton-polyester blend fabric. In addition, high build but highly transparent prints are possible in order to create the 'gel' effect. However, unlike its counterpart in plastisol, these gel prints are smooth, very glossy and free of tack. Aquasol Glitter Paste can also be used as high gloss overglaze to enhance gloss on other printed surfaces. Aquasol Glitter Paste is also very transparent and can be used with glitter, metallic and reflective pigments.

Application Procedure

Print Aquasol Glitter Paste directly onto fabric or on top of Aquasol Aquaprene inks. Unlike regular glitter inks which can become detached from the surface of the rubber inks during washing, Aquasol Glitter Paste is compatible with Aquasol Aquaprene inks to provide wash resistant and very soft prints. Mix glitter, metallic, reflective and other pigments directly into Aquasol Glitter Paste and stir until homogenous either manually or with a slow speed mixer. Aquasol Glitter Paste is suitable for silkscreen prints with screen mesh sizes of 1000-1300. However, lower mesh screens may be necessary for glitter/metallic/reflective prints depending on the size of the pigment used. After ambient drying, the prints are fully cured at 150°C for 2 min. or heatpress at 135°C for 10 s.

Storage

Do not exceed twelve months from date of manufacture. Protect from frost (>5°C). Keep lids tightly closed at all times after use.
